SYNCHRON® System(s)  THC5  Chemistry Information Sheet

Cannabinoid 50 ng  REF 475030

For In Vitro Diagnostic Use

ANNUAL REVIEW

Reviewed by:  Reviewed by:  Date

Refer to coversheet in front of method

PRINCIPLE

INTENDED USE

THC5 reagent, when used in conjunction with SYNCHRON LX®, System(s), UniCel® DxC 600/800 System(s) and SYNCHRON® Systems THC Urine Calibrators, is intended for qualitative determination of cannabinoids concentration in human urine.

This assay provides a rapid screening procedure for determining the presence of cannabinoids in urine, using a 50 ng/mL cutoff value. This test provides only a preliminary analytical result; a positive result by this assay should be confirmed by another generally accepted non-immunological method such as thin layer chromatography (TLC), gas chromatography (GC), or gas chromatography/mass spectrometry (GC/MS). GC/MS is the preferred confirmatory method.1,2

Clinical consideration and professional judgement should be applied to any drug of abuse test result, particularly when preliminary positive results are used.

CLINICAL SIGNIFICANCE

Cannabinoid hallucinogenic compounds include delta-9-tetrahydrocannabinol, cannabidiol and cannabiol. Measurements of cannabinoids are used in the diagnosis and treatment of cannabinoid use or abuse, and in monitoring the presence of cannabinoids during clinical investigational use.

METHODOLOGY

The THC5 assay utilizes a homogenous enzyme immunoassay method.3 The THC5 reagent is comprised of specific antibodies which can detect cannabinoid metabolite in urine. A drug-labeled glucose-6-phosphate dehydrogenase (G6PDH) conjugate competes with any free drug from the urine sample for a fixed amount of specific antibody binding sites. In the absence of free drug from the sample, the drug-labeled G6PDH conjugate is bound by the specific antibody and enzyme activity is inhibited. This reaction creates a direct relationship between drug concentration and enzyme activity. The G6PDH enzyme activity is determined spectrophotometrically by measuring its ability to convert nicotinamide adenine dinucleotide (NAD) to NADH (reduced form).

The SYNCHRON® System(s) automatically proportions the appropriate sample and reagent volumes into the cuvette. The ratio for THC5 is one part sample to 10 parts reagent. The system monitors the change in absorbance at 340 nanometers to calculate and express a reaction rate. A qualitative result is reported based on a comparison of the sample rate to the calibrated cutoff rate.
CHEMICAL REACTION SCHEME

\[
\begin{align*}
(a) & \quad \text{Ab + THC}_{\text{free}} + \text{THC-G6PDH(Conj)} \rightarrow \text{Ab-THC + THC-G6PDH(Conj)} \\
& \quad \text{(active enzyme)} \\
& \quad \text{Ab + THC-G6PDH(Conj)} \rightarrow \text{Ab-THC-G6PDH(Conj)} \quad \text{(inactive enzyme)} \\
(b) & \quad \text{NAD}^+ + \text{G-6-P} \quad \text{(active enzyme)} \rightarrow \text{NADH + H}^+ + \text{6-phosphogluconate} \quad (\lambda_{\text{max}} = 340 \text{ nm})
\end{align*}
\]

GENERAL DISCUSSION

The major psychoactive agent in marijuana and hashish is delta-9-tetrahydrocannabinoid (THC). THC is rapidly metabolized and distributed to body tissues, so that none is excreted in urine unchanged. 11-nor-delta-9-THC-9-carboxylic acid, the principle metabolite, becomes detectable in plasma, feces and urine within hours after exposure. \(^4\) In chronic users, THC may accumulate in fatty tissue faster than it can be excreted, leading to longer detection times in urine for chronic users than for occasional users. Passive inhalation of marijuana smoke can result in an elevation of urine THC concentration as high as 10 to 40 ng/mL \(^5,6\)

SPECIMEN

TYPE OF SPECIMEN

Freshly collected urine samples should be used for testing. Collect urine samples in glass or plastic (i.e., polypropylene, polycarbonate, polyethylene) containers. Some plastics absorb drugs.\(^7,8\) Urine samples should be collected in the manner routinely used for drug screening analysis.\(^9\) Samples should be at room temperature for testing.\(^10\)

SPECIMEN STORAGE AND STABILITY

If the sample cannot be analyzed immediately, it may be stored at +2°C to +8°C for up to 7 days.\(^2,9\) If longer storage is required or when a split sample collection method is used, samples should be stored frozen at -20°C or less.\(^9\)

ADDITIONAL SPECIMEN STORAGE AND STABILITY CONDITIONS AS DESIGNATED BY THIS LABORATORY:

Refer to “Sample Integrity in Chemistry” write up in “Policies and Procedures” manual

SAMPLE VOLUME

The optimum volume, when using a 0.5 mL sample cup, is 0.3 mL of sample. For optimum primary sample tube volumes and minimum volumes, refer to the Primary Tube Sample Template for your system.

CRITERIA FOR UNACCEPTABLE SPECIMENS

Refer to the PROCEDURAL NOTES section of this chemistry information sheet for information on unacceptable specimens.
CRITERIA FOR SAMPLE REJECTION AS DESIGNATED BY THIS LABORATORY:

Refer to “Sample Integrity in Chemistry” write up in “Policies and Procedures” manual

PATIENT PREPARATION

SPECIAL INSTRUCTIONS FOR PATIENT PREPARATION AS DESIGNATED BY THIS LABORATORY:

Refer to “Sample Integrity in Chemistry” write up in “Policies and Procedures” manual

SPECIMEN HANDLING

SPECIAL INSTRUCTIONS FOR SPECIMEN HANDLING AS DESIGNATED BY THIS LABORATORY:

Refer to “Sample Integrity in Chemistry” write up in “Policies and Procedures” manual

Antibody/Substrate Reagent

Enzyme Conjugate Reagent

REACTIVE INGREDIENTS

REAGENT CONSTITUENTS

Antibody/Substrate Reagent:

- Monoclonal anti-^6^THC antibodies (mouse)
- Glucose-6-phosphate (G6P)
- Nicotinamide adenine dinucleotide (NAD)
- Tris buffer

Enzyme Conjugate Reagent:

- Glucose-6-phosphate dehydrogenase (G6PDH) labeled with ^6^THC
- Tris buffer
REAGENT CONSTITUENTS
Also non-reactive chemicals necessary for optimal system performance.

⚠️ CAUTION

Sodium azide preservative may form explosive compounds in metal drain lines. See National Institute for Occupational Safety and Health Bulletin: Explosive Azide Hazards (8/16/76).

MATERIALS NEEDED BUT NOT SUPPLIED WITH REAGENT KIT
SYNCHRON Systems DAT Negative Urine Calibrator (0 ng/mL 11-nor-\(\Delta^9\)-THC-9-carboxylic acid)
SYNCHRON Systems 50 ng/mL THC Urine Calibrator (50 ng/mL 11-nor-\(\Delta^9\)-THC-9-carboxylic acid)
SYNCHRON Systems 100 ng/mL THC Urine Calibrator (100 ng/mL 11-nor-\(\Delta^9\)-THC-9-carboxylic acid)
SYNCHRON Systems 20 ng/mL THC Urine Control (20 ng/mL 11-nor-\(\Delta^9\)-THC-9-carboxylic acid)
SYNCHRON Systems 75 ng/mL THC Urine Control (75 ng/mL 11-nor-\(\Delta^9\)-THC-9-carboxylic acid)

REAGENT PREPARATION
No preparation is required.

ACCEPTABLE REAGENT PERFORMANCE
The acceptability of a reagent is determined by successful calibration and by ensuring that quality control results are within acceptance criteria. Refer to the Quality Control section of this chemistry information sheet for Substance Abuse and Mental Health Services Administration (SAMHSA) guidelines.

REAGENT STORAGE AND STABILITY
THC5 reagent when stored unopened at +2°C to +8°C, will remain stable until the expiration date printed on the cartridge label. Once opened, the reagent is stable for 90 days at +2°C to +8°C unless the expiration date is exceeded. DO NOT FREEZE.

REAGENT STORAGE LOCATION:
Chemistry section, room L568. Refer to reagent “map” on Chemistry refrigerator #8.

CALIBRATION

CALIBRATOR REQUIRED
SYNCHRON Systems DAT Negative Urine Calibrator (0 ng/mL 11-nor-\(\Delta^9\)-THC-9-carboxylic acid)
SYNCHRON Systems 50 ng/mL (cutoff) THC Urine Calibrator (50 ng/mL 11-nor-\(\Delta^9\)-THC-9-carboxylic acid)
SYNCHRON Systems 100 ng/mL THC Urine Calibrator (100 ng/mL 11-nor-\(\Delta^9\)-THC-9-carboxylic acid)
CALIBRATOR PREPARATION

No preparation is required.

CALIBRATOR STORAGE AND STABILITY

SYNCHRON® Systems THC Urine Calibrators is stable until the expiration date printed on the calibrator bottle if capped and stored in the original container at +2°C to +8°C.

CAUTION

Urine is not known to transmit infectious disease such as Hepatitis or HIV. However, because this product contains material of human origin, it should be handled as though capable of transmitting infectious diseases. The United States Food and Drug Administration recommends such samples be handled as specified in the Centers for Disease Control’s Biosafety Level 2 guidelines.\(^\text{11}\)

CALIBRATOR STORAGE LOCATION:

Chemistry section, room L568. Refer to reagent “map” on Chemistry refrigerator #8.

CALIBRATION INFORMATION

1. The DAT assays require three levels of calibrators. The calibration measures the separation between calibrators to ensure reagent integrity.

   NOTICE

   The calibration factor generated is non-functional for sample result calculation.

2. The system must have a valid calibrator cutoff value in memory before controls or patient samples can be run. The cutoff value for each DAT chemistry represents the mean reaction rate of the Low Calibrator, and is reported in mA/min units on patient and control reports. Cutoff values are stored in memory until the next successful calibration.

3. Under typical operating conditions the THC5 reagent cartridge must be calibrated every 14 days and also with certain parts replacements or maintenance procedures, as defined in the SYNCHRON LX Maintenance Manual and Instrument Log, or the UniCel DxC 600/800 System Instructions For Use (IFU) manual. This assay has within-lot calibration available. Refer to the SYNCHRON LX Operations Manual, or the UniCel DxC 600/800 System Instructions For Use (IFU) manual for information on this feature.

4. For detailed calibration instructions, refer to the SYNCHRON LX Operations Manual, or the UniCel DxC 600/800 System Instructions For Use (IFU) manual.

5. The system will automatically perform checks on the calibration and produce data at the end of calibration. In the event of a failed calibration, the data will be printed with error codes and the system will alert the operator of the failure. For information on error codes, refer to the SYNCHRON LX Diagnostics and Troubleshooting Manual, or the UniCel DxC 600/800 System Instructions For Use (IFU) manual.
TRACEABILITY
For Traceability information refer to the Calibrator instructions for use.

QUALITY CONTROL

Good laboratory practices suggest the use of control specimens to ensure proper assay performance. Each analytical run should include controls with levels 25% above and 25% below the cutoff threshold of each drug, as well as negative specimens certified to contain no drug. In addition, these controls should be run with each new calibration, and after specific maintenance or troubleshooting procedures as detailed in the appropriate system manual. More frequent use of controls or the use of additional controls is left to the discretion of the user based on good laboratory practices or laboratory accreditation requirements and applicable laws.

The following controls should be prepared and used in accordance with the package inserts. Discrepant quality control results should be evaluated by your facility.

TESTING PROCEDURE(S)

1. If necessary, load the reagent onto the system.
2. After reagent load is completed, calibration may be required.
3. Program samples and controls for analysis.
4. After loading samples and controls onto the system, follow the protocols for system operations.

For detailed testing procedures, refer to the SYNCHRON LX Operations Manual, or the UniCel DxC 600/800 System Instructions For Use (IFU) manual.

RESULTS INTERPRETATION

The system performs all calculations internally to produce the final qualitative result, reported as POSITIVE or NEGATIVE. The qualitative result is based on a comparison of the sample rate to the calibrated cutoff rate; a sample rate greater than or equal to the cutoff rate is reported as POSITIVE. A POSITIVE result ($\geq 50$ ng/mL) from this assay indicates only the presence of cannabinoids and does not necessarily correlate with the extent of physiological and psychological effects. A NEGATIVE test result indicates that cannabinoids are either not present, or are present at levels below the cutoff threshold of the test.

REPORTING RESULTS

Equivalency between the SYNCHRON LX and UniCel DxC 600/800 Systems has been established. Chemistry results between these systems are in agreement and data from representative systems may be shown.
PROCEDURAL NOTES

LIMITATIONS
1. The test is designed for use with human urine only.
2. Do not dilute the urine samples since this is a qualitative assay. Dilution of samples may produce erroneous results.
3. Interference has been demonstrated from mefenamic acid, a nonopioid analgesic.\(^{13}\)
4. Adulteration of the urine sample may cause erroneous results. Alteration of a urine specimen may be detected by checking the appearance, temperature, pH, specific gravity, and creatinine levels of a sample.\(^9\) If adulteration is suspected, obtain another sample and forward both specimens to the laboratory for testing.
5. An effort should be made to keep pipetted samples free from gross debris. It is recommended that highly turbid specimens be centrifuged before analysis.

Note: For screening assays of this type, only POS or NEG is reported. Occasionally error codes, e.g. Reaction Rate Hi/Low, Blank Rate Hi/Low, Reaction ABS Hi/Low may be sent from the DXC. The error messages may be due to sample integrity or a possible interfering substance. Rarely, the error may be due to bubbles in the reagent. Whenever an error code is generated, repeat the test. If the repeat assay generates the same DXC error code, in Sunquest send English Text code INTC “Interfering Substance, unable to do” as the result. Do not dilute the sample.

PERFORMANCE CHARACTERISTICS

RELATIVE SENSITIVITY AND SPECIFICITY

One hundred twenty-one clinical urine specimens were collected and tested. Using the SYNCHRON CX7 DELTA System as a reference method, 45 samples tested positive and 73 tested negative. The cutoff value of the SYNCHRON Systems Cannabinoid 50 ng assay is 50 ng/mL.

Each laboratory should characterize their own instrument performance for comparison purposes. Instruments operated and maintained according to manufacturer’s instructions should exhibit a within-run coefficient of variation of ≤ 2.0% for all sample levels.

**NOTICE**

These degrees of precision and equivalency were obtained in typical testing procedures on a SYNCHRON LX® System and are not intended to represent the performance specifications for this reagent.

**ADDITIONAL INFORMATION**

For more detailed information on SYNCHRON LX Systems or UniCel DxC Systems, refer to the appropriate system manual.

**SHIPPING DAMAGE**

If damaged product is received, notify your Beckman Coulter Clinical Support Center.
